Success is ... when hops and malt are never lost

Flottweg presents its solutions for the brewing industry at BrauBeviale 2019 in Nuremberg. This year, the focus is primarily on the topic of the efficient use of resources. The topic is directly connected with minimizing beer losses in the cold area of the brewery.

In addition to the proven Flottweg separator technology, special attention will be paid this year to decanter centrifuges. The decanter process developed by Flottweg working together with international customers makes possible previously unattainable cost savings in the area of dry hopping due to a higher yield. Hops and malt aren't lost after all.

Flottweg solutions at a glance:

- Separators for clarifying beers and for defined turbidity adjustment
- Decanter centrifuges for beer recovery from hop pulp and for waste water treatment and dewatering of diatomaceous earth
- Sedicenter® for the recovery of beer from fermentation and tank bottoms yeasts

Thanks to the Flottweg engineers, each of these machines, including their integration into the existing process, is perfectly adapted to the requirements of the customer and thus guarantees an efficient and user-friendly design in all areas.
